

# Security and HTTPS

As part of our ongoing commitment to improving and enhancing VQManager, we have recently completed a major security enhancement.

## **What's HTTPS?**

HTTPS (Hypertext Transfer Protocol Secure) is a communications protocol which guards against any data traffic being maliciously intercepted whilst 'en route'. So when you enter your password into VQManager, for instance, HTTPS will encrypt it before it is transmitted. HTTPS running on our own servers will then de-encrypt it upon receipt so that it can be read and processed. Any traffic intercepted between yourself and our servers will be in an encrypted form and therefore unintelligible.
